

Utility Plan: The facility will require multiple light duty single phase 240v and 120v air compressors to run the landing aeration grid and the folding pneumatic jump tops. Additionally, a light duty single phase irrigation pump will be required to irrigate the inrun plastic. There will also be minimal 120v electrical needs for indoor lighting, ski waxing, and miscellaneous uses at the storage sheds. Existing SSRC electrical infrastructure is adequate and will be utilized to meet the anticipated load requirements with details to be finalized at the time of building permit.
